

Coding Components & Feasibility Reports

Features Planned and Technologies:

- One long vertical scroll experience
 - GSAP for scroll triggers, HTML and CSS
- Opening poll: Yes/No question on car ownership (Optional: Additional Why)
 - HTML inputs, standard JS to capture responses
- Pie Chart displaying generalized why people have cars/pre-researched data
 - [Chart.js](#) and prior/pre-set data
- Car Cost Calculator: Inputs payment (Insurance/Gas/Maintenance)
 - Percentage Breakdown of costs and lifelong accumulation (10 vs 30 yrs)
 - HTML inputs and standard JS math, DOM manipulation
- PetroDollar explanation: Single page with moving overlays
 - One section for generalized explanation
 - Another section for history/how it was created
 - HTML/CSS transitions
- Implications on US: Visual Map showcases top oil exporter states/US current international relation with them
 - HTML/CSS for layout, SVG or [chart.js](#) for interactivity map
- Domestic consequences: (DONE) case study on US highway system
 - Can include more GSAP functions to increase interactivity
- Call to Action: re-asks opening question (Did you really choose to own a car)
- Final pie chart: displaying user responses to final question (backend JSON)
 - Chart.js , used JSON backend to retrieve real responses

Skill Assessment and Difficulties

- I am very comfortable with HTML/CSS layout, standard JavaScript and DOM manipulation as well as scroll animation. I am also confident the math/logic needed for the JS math for calculator
- I am developing my skills in using libraries such as GSAP and [Chart.js](#).
- I need more time learning/reviewing backend JSON and how that can be used for pie chart
- The main difficulties I am facing are the interactive sections of my website and how it will affect the loading. More so specifically how to produce the interactive map using JS libraries and how to create the results piechart.
- I do need to find 1-2 strong sources on the US implications map. I may have to simplify that to a single timeline showcasing how the US shifts its plan according to oil supply/relations.
