

Comparative Analysis

The Pudding

Interface Design:

Infinite scrolling format, the more you scroll down the more the story unravels. Includes a mix of both animation, text and pictures to convey the whole story. Mainly starts with a small antidote from the author as a way to hook the reader. Then transitions into an article formatted similar to one that could be found on New York Times.

- **Consider using story telling as a way to move the user forward.**
Scrolling/storytelling can unfold information in a way that users can both understand and engage with.

Interactivity:

The infinite scrolling and animation allows the user to feel like they are walking through the experience/have control of the pace. Later on, a game simulation is added to help further explain/reinforce a complicated idea.

- **Consider including mini games and interactions to help visualize/explain situations**

Content:

Mixes both research and storytelling to explain concepts and ideas. Models are explained using visualization, fake scenarios and illustrations. However, the author also links original research when introducing a new concept. Also incorporates data visualization to explain the math/statistics behind the concepts

- **Consider using data to help explain long run situations/trends**

Our World in Data: Energy & Economics

Interface Design/Interactivity

Mainly consists of data visualizations and graphs of different energy levels and infrastructure. The main focus is the interactive map that visualizes the Per capita energy consumption from solar, 2024 per country using kilowatt-hours per person. Users are allowed to single out certain countries/continents. Filters include different countries, North America, world, high income countries, etc. Also able to distinguish different sources of energy (Solar, Oil, Gas, Renewables, etc) and also electricity only vs primary energy and different types of metrics (Annual vs per capita generation vs share of total. There are also formats of visualizations such as tables, world maps, line charts and bar charts.

- **Consider including interactive data visualizations to boost interactivity and engagement from users. Also including different formats to allow users to better understand the data in their own terms.**
